

Cylinder with Lock

Series CNS

ø125, ø140, ø160

A locking cylinder ideal for intermediate stops, emergency stops and drop prevention.

Simple construction

A force magnifying mechanism is employed based on the wedge effect of the taper ring and steel balls.

A metal rod scraper Standard equipment

Resistance against welding process spatter and other external contaminants is achieved by providing a metal rod scraper as standard.

High locking efficiency

Greater locking efficiency as well as stable locking and unlocking operation has been achieved by arranging a large number of steel ball bearings in circular rows. (Unlocking pressure of 0.25 MPa 0.05 MPa lower than conventional SMC products) In addition, both alignability and stable locking force with respect to piston rod eccentricity are obtained by allowing the taper ring to float.

Manual override for unlocking for emergency

Even if the air supply is blocked or exhausted, lock release is possible. The fail safe mechanism locks again when the manual override is released.

High reliability and stable holding force

Outstanding durability and stable holding force are maintained by the use of a brake shoe having superior wear resistance, which has also been substantially lengthened (double the conventional SMC product).

Design minimizes the influences of unlocking air quality

A construction which is strong against moisture and drainage in the compressed air has been realized by separating the locking mechanism and the unlocking chamber.

Series Variations

Series	Action	Type	Standard variations With rod boot	Bore size (mm)	Lock holding force (kN)	Standard stroke (mm)
Cylinder with lock Series CNS	Double acting	Single rod Series CNS		125	8.4	Maximum 1600
				140	10.5	
				160	13.8	

Can be locked in both directions

All equal holding force can be obtained on either reciprocating stroke of the cylinder.

Series CNS Model Selection

Precautions on Model Selection

⚠ Caution

1. In order that the originally selected maximum speed is not exceeded, be certain to use a speed controller to adjust the total movement distance of the load so that movement takes place in no less than the applicable movement time. The movement time is the time that is necessary for the load to travel the total movement distance from the start without any intermediate stops.
2. In cases where the cylinder stroke and the movement distance of the load are different (double speed mechanism, etc.), use the movement distance of the load for selection purposes.

Example)

3. The following selection example and procedures are based on use at the intermediate stop (including emergency stops during the operation). However, when the cylinder is in the locked state, kinetic energy does not act upon it. Under these conditions, use the load mass at the maximum speed (V) of 100 mm/s shown in graphs 5 to 7 on page 759 depending on the operating pressure and select models.

Selection Example

- Load mass: $m = 320 \text{ kg}$
- Movement distance: $st = 400 \text{ mm}$
- Movement time: $t = 2 \text{ s}$
- Load condition: Vertical downward = Load in direction of rod extension
- Operating pressure: $P = 0.4 \text{ MPa}$

Step (1): From graph (1) find the maximum movement speed of the load

$\therefore$ Maximum speed $V: \cong 280 \text{ mm/s}$

Step (2): Select Graph(6) based upon the load condition and operating pressure, and then from the intersection of the maximum speed $V = 280 \text{ mm/s}$ found in Step (1), and the load mass $m = 320 \text{ kg}$

$\therefore \phi 140 \rightarrow$ select a CNS140 or larger bore size.

Step 1 Find the maximum load speed V .

Find the maximum load speed: V (mm/s) from the load movement time: t (s) and the movement distance: st (mm).

Graph (1)

Step 2 Find the bore size.

Select a graph based upon the load condition and operating pressure, and then find the point of intersection for the maximum speed found in Step (1) and the load mass. Select the bore size on the line above the point of intersection.

Load Condition

Load in the direction at the right angle to rod

(* Being held by a guide)

Operating Pressure

$0.3 \text{ MPa} \leq$ → Graph (2)

$0.4 \text{ MPa} \leq$ → Graph (3)

$0.5 \text{ MPa} \leq$ → Graph (4)

Load in the direction of rod extension
Load in the direction of rod retraction

$0.3 \text{ MPa} \leq$ → Graph (5)

$0.4 \text{ MPa} \leq$ → Graph (6)

Cylinder with Lock Double Acting, Single Rod Series *CNS*

ø125, ø140, ø160

How to Order

CNS L 125 100 D

With auto switch **CDNS L 125 100 D M9BW**

Mounting style

B	Basic style
L	Foot style
F	Rod side flange style
G	Head side flange style
C	Single clevis style
D	Double clevis style
T	Center trunnion style

Tubing material

Nil	Aluminum tube
F*	Steel tube

* Auto switches are not available with steel tube.

Bore size

125	125 mm
140	140 mm
160	160 mm

Thread type

Nil	Rc
TN	NPT
TF	G

Cylinder stroke (mm)

Refer to page 761 for maximum stroke.

Number of auto switches

Nil	2 pcs.
S	1 pc.
n	"n" pcs.

Auto switch

Nil	Without auto switch
-----	---------------------

* Select applicable auto switch part numbers from the table below.

Locking direction

D	Both directions
---	-----------------

Made to Order

Refer to page 761 for details.

With rod boot/cushion

Rod boot	J	Nylon tarpaulin
	K	Heat resistant tarpaulin
Cushion	Nil	With double-side cushion
	N	Without cushion
	R	With rod cushion
	H	With head cushion

* When the symbols are two or more, indicate them alphabetically.

Built-in Magnet Cylinder Model

If a built-in magnet cylinder without an auto switch is required, there is no need to enter the symbol for the auto switch.
(Example) CDNSL140-100-D

Applicable Auto Switch/Refer to pages 1719 to 1827 for further information on auto switches.

Type	Special function	Electrical entry	Indicator light	Wiring (Output)	Load voltage			Auto switch model		Lead wire length (m)					Pre-wired connector	Applicable load

** Water resistant type auto switches can be mounted on the above models, but in such case SMC cannot guarantee water resistance. Consult with SMC regarding water resistant types with the above model numbers.

* Lead wire length symbols: 0.5 m Nil (Example) M9NW
1 m M (Example) M9NWM
3 m L (Example) M9NWL
5 m Z (Example) M9NWX

* Solid state auto switches marked with "○" are produced upon receipt of order.

* There are other applicable auto switches than listed above. For details, refer to page 775.

* For details about auto switches with pre-wired connector, refer to pages 1784 and 1785.

* D-A9/M9/M9W/M9AL auto switches are shipped together (not assembled). (Only auto switch brackets are assembled at the time of shipment.)

JIS Symbol

Made to Order Specifications
(For details, refer to pages 1836 and 1844.)

Symbol	Specifications
—XA□	Change of rod end shape
—XC14	Change of trunnion bracket mounting position

Refer to pages 773 to 775 for cylinders with auto switches.

- Minimum auto switch mounting stroke
- Proper auto switch mounting position (detection at stroke end) and mounting height
- Operating range
- Switch mounting bracket: Part no.

Cylinder Specifications

Bore size (mm)	125	140	160
Lube	Not required (Non-lube)		
Fluid	Air		
Proof pressure	1.57 MPa		
Max. operating pressure	0.97 MPa		
Min. operating pressure	0.08 MPa		
Piston speed	50 to 500 mm/s *		
Ambient and fluid temperature	Without auto switch: 0 to 70°C (No freezing) With auto switch: 0 to 60°C (No freezing)		
Cushion	Air cushion		
Stroke length tolerance	Up to 250: $^{+1.0}_0$, 251 to 1000: $^{+1.4}_0$, 1001 to 1500: $^{+1.8}_0$, 1501 to 1600: $^{+2.2}_0$		
Mounting	Basic style, Axial foot style, Rod side flange style, Head side flange style, Single clevis style, Double clevis style, Center trunnion style		

* Load limits exist depending upon piston speed when locked, mounting direction and operating pressure.

Lock Specifications

Bore size (mm)	125	140	160
Locking action	Spring locking (Exhaust lock)		
Unlocking pressure	0.25 MPa or more		
Lock starting pressure	0.20 MPa or less		
Operating pressure range	0.25 to 0.7 MPa		
Locking direction	Both directions		
Holding force (kN)	8.4	10.5	13.8

* Be sure to make cylinder selections in accordance with the method given on page 758.

Cylinder Stroke

Tube material	Aluminum alloy	Carbon steel pipe	
Bore size (mm)	Basic style, Head side flange style, Single clevis style, Double clevis style, Center trunnion style	Basic style, Head side flange style, Single clevis style, Double clevis style, Center trunnion style	Foot style, Rod side flange style
125, 140	Up to 1000	Up to 1000	Up to 1600
160	Up to 1200	Up to 1200	Up to 1600

Cylinder Stroke/Auto Switch Mounting on Cylinder Unit (Built-in Magnet)

Refer to the minimum auto switch mounting stroke (page 774) for those with an auto switch.

Bore size (mm)	Basic style, Head side flange style, Single clevis style, Double clevis style, Center trunnion style	Foot style, Rod side flange style
125, 140	Up to 1000	Up to 1400
160	Up to 1200	Up to 1400

Stopping Accuracy

Lock type	Piston speed (mm/s)		
	100	300	500
Spring locking	±0.5	±1.0	±2.0

Condition: Lateral, Supply pressure P = 0.5 MPa

Load mass Upper limit of allowed value

Solenoid valve for locking Mounted directly to unlocking port

Maximum value of stopping position dispersion from 100 measurements

** Refer to page 772 when the rod end nut, and the single and double knuckle joints are used together.

Mass / () : Denotes the values for steel tube.

Bore size (mm)		125	140	160
Lock unit mass		14.40	20.20	30.60
Basic mass	Basic style	28.79 (30.26)	37.67 (39.48)	55.31 (57.52)
	Foot style	30.42 (31.89)	40.19 (42.00)	58.11 (60.32)
	Flange style	31.47 (32.94)	42.67 (44.48)	61.70 (63.91)
	Single clevis style	31.86 (33.33)	41.96 (43.77)	60.80 (63.01)
	Double clevis style (Including clevis pin and cotter pin)	32.32 (33.79)	42.71 (44.52)	61.65 (63.86)
	Trunnion style	32.92 (34.39)	43.40 (45.21)	62.71 (64.92)
Additional mass per each 100 mm of stroke		1.77 (2.66)	1.96 (3.01)	2.39 (3.58)
Accessory bracket	Single knuckle joint	0.91	1.16	1.56
	Double knuckle joint (With pin)	1.37	1.81	2.48
	Rod end nut	0.16	0.16	0.23

Calculation: (Example) **CNSL140-100-D** Basic mass..... 40.19 (Foot style, ø140)
 Additional mass 1.96/100 stroke
 Cylinder stroke 100 stroke
 $40.19 + 1.96 \times 100/100 = 42.15 \text{ kg}$

Construction Principle

Spring locking (Exhaust lock)

The spring force which acts upon the taper ring is magnified by a wedge effect, and is conveyed to all of the numerous steel balls which are arranged in two circles. These act on the brake shoe holder and brake, which locks the piston rod by tightening against it with a large force.

Unlocking is accomplished when air pressure is supplied to the unlocking port. The release piston and taper ring oppose the spring force, moving to the right side, and the ball retainer strikes the cover section A. The braking force is released as the steel balls are removed from the taper ring by the ball retainer.

Construction

Component Parts

No.	Description	Material	Note
1	Cover A	Aluminum alloy	Hard anodized and painted
2	Cover B	Aluminum alloy	Hard anodized and painted
3	Rod cover	Rolled steel plate	Black painted
4	Head cover	Rolled steel plate	Black painted
5	Cylinder tube	Aluminum alloy	Hard anodized
6	Piston rod	Carbon steel	Hard chrome plated
7	Piston	Aluminum alloy casted	Chromated

Replacement Parts/Seal Kit

Bore size (mm)	Kit no.	Contents
125	CS1N125A-PS	Set of above nos. 46, 48, 49, 53, 54, 57
140	CS1N140A-PS	
160	CS1N160A-PS	

* Since the lock section for Series CNS is normally replaced as a unit, kits are for the cylinder section only. These can be ordered using the order number for each bore size.
 * Seal kit includes 46, 48, 49, 53, 54, 57. Order the seal kit, based on each bore size.
 * Seal kit includes a grease pack (40 g).
 Order with the following part number when only the grease pack is needed.
Grease pack part no.: GR-S-010 (10 g), GR-S-020 (20 g)

160		120	56	110	170.5	I-16	Y-16

A, H Dimensions When Mounting a Single/Double Knuckle Joint together with a Rod End Nut

Bore size (mm)	A	H
125	65	125
140	65	125
160	76	140

- * Single knuckle joint and double knuckle joint should be used separately.
(Fasten by screwing completely into the rod end threads.)
- * Extend the dimensions of **A** and **H**, when using a single/double knuckle joint together with a rod end nut.
For extension of **A** and **H** dimensions, refer to the table above and specify "Simple Specials -XA0" (page 1836).

[Mounting screw set made of stainless steel]

The following set of mounting screws made of stainless steel (including nuts) is available. Use it in accordance with the operating environment. (Please order the auto switch mounting bracket separately, since it is not included.)

BBA1: For D-A5/A6/F5/J5 types

D-F5BAL auto switch is set on the cylinder with the stainless steel screws above when shipped. When an auto switch is shipped independently, BBA1 is attached.

Note 1) Refer to page 1821 for the details of BBA1.

Note 2) When using D-M9□A(V)/Y7BAL, do not use the steel set screws which is included with the auto switch mounting brackets above (BS5-□□□, BS4-□□□). Order a stainless steel screw set (BBA1) separately, and select and use the M4 x 8L stainless steel set screws included in the BBA1.

• The above figure shows the mounting example of D-A9□(V)/M9□(V)/M9□W(V)/ M9□A(V)L.

Other than the applicable auto switches listed in “How to Order”, the following auto switches can be mounted. For detailed specifications, refer to pages 1719 to 1827.

Auto switch type	Model	Electrical entry (Fetching direction)	Features
Reed	D-A90V	Grommet (Perpendicular)	Without indicator light
	D-A93V, A96V		
	D-Z73, Z76		—
	D-A53, A56	Grommet (In-line)	Without indicator light
	D-A64, A67		
	D-Z80		
Solid state	D-M9NV, M9PV, M9BV	Grommet (Perpendicular)	—
	D-Y69A, Y69B, Y7PV		
	D-M9NWV, M9PWV, M9BWV		2-color indication
	D-Y7NWV, Y7PWV, Y7BWV		
	D-M9NAVL, M9PAVL, M9BAVL		Water resistant (2-color indication)
	D-F59, F5P, J59	Grommet (In-line)	—
	D-Y59A, Y59B, Y7P		
	D-F59W, F5PW, J59W		2-color indication
	D-Y7NW, Y7PW, Y7BW		
	D-F5BAL, Y7BAL		Water resistant (2-color indication)
	D-F5NTL		With timer

* With pre-wired connector is available for solid state auto switches. For details, refer to pages 1784 and 1785.

* Normally closed (NC = b contact), solid state auto switch (D-F9G/F9H/Y7G/Y7H types) are also available. For details, refer to pages 1746 and 1748.

Series CNS Specific Product Precautions 1

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Design of Equipment and Machinery

Warning

1. Construct so that the human body will not come into direct contact with driven objects or the moving parts of the cylinders with lock.

Devise a safe structure by attaching protective covers that prevent direct contact with the human body, or in cases where there is a danger of contact, provide sensors or other devices to perform an emergency stop, etc., before contact occurs.

2. Use a balance circuit, taking cylinder lurching into consideration.

In cases such as an intermediate stop, where a lock is operated at a desired position within the stroke and air pressure is applied from only one side of the cylinder, the piston will lurch at high speed when the lock is released. In such situations, there is a danger of causing human injury by having hands or feet, etc. caught, and also a danger for causing damage to the equipment. In order to prevent this lurching, a balance circuit such as the recommended pneumatic circuits (page 777) should be used.

Selection

Warning

1. When in the locked state, do not apply a load accompanied by an impact shock, strong vibration or turning force, etc.

Use caution, because an external action such as an impacting load, strong vibration or turning force, may damage the locking mechanism or reduce its life.

2. Consider stopping accuracy and the amount of over-run when an intermediate stop is performed.

Due to the nature of a mechanical lock, there is a momentary lag with respect to the stop signal, and a time delay occurs before stopping. The cylinder stroke resulting from this delay is the overrun amount. The difference between the maximum and minimum overrun amounts is the stopping accuracy.

- Place a limit switch before the desired stopping position, at a distance equal to the overrun amount.
- The limit switch must have a detection length (dog length) of the overrun amount + α .
- SMC's auto switches have operating ranges from 8 to 14 mm (depending on the switch model).

When the overrun amount exceeds this range, self-holding of the contact should be performed at the switch load side.

*For stopping accuracy, refer to page 761.

Selection

Warning

3. In order to further improve stopping accuracy, the time from the stop signal to the operation of the lock should be shortened as much as possible.

To accomplish this, use a device such as a highly responsive electric control circuit or solenoid valve driven by direct current, and place the solenoid valve as close as possible to the cylinder.

4. Note that the stopping accuracy will be influenced by changes in piston speed.

When piston speed changes during the course of the cylinder stroke due to variations in the load or disturbances, etc., the dispersion of stopping positions will increase. Therefore, consideration should be given to establishing a standard speed for the piston just before it reaches the stopping position.

Moreover, the dispersion of stopping positions will increase during the cushioned portion of the stroke and during the accelerating portion of the stroke after the start of operation, due to the large changes in piston speed.

5. The holding force (max. static load) indicates the maximum capability to hold a static load without loads, vibration and impact. This does not indicate a load that can be held in ordinary conditions.

Select the most suitable bore sizes for the operating conditions in accordance with the selection procedures. The Model Selection (pages 758 and 759) is based on use at the intermediate stop (including emergency stops during the operation). However, when the cylinder is in a locked state, kinetic energy does not act upon it. Under these conditions, use the load mass at the maximum speed (V) of 100 mm/s shown in the graphs 5 to 7 on page 759 depending on the operating pressure and select models.

Mounting

Warning

1. Be certain to connect the rod end to the load with the lock released.

If connected in the locked state, a load greater than the turning force or holding force, etc. may operate on the piston rod and cause damage to the lock mechanism. Series CNS is equipped with an emergency unlocking mechanism; however, when connecting the rod end to the load, this should be done with the lock released. This can be accomplished by simply connecting an air line to the unlocking port and supplying air pressure of 0.25 MPa or more.

2. Do not apply offset loads to the piston rod.

Particular care should be taken to match the load's center of gravity with the center of the cylinder shaft. When there is a large discrepancy, the piston rod may be subjected to uneven wear or damage due to the inertial moment during locking stops.

Note) Can be used if all of the generated moment is absorbed by an effective guide.

Series CNS Specific Product Precautions 2

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Mounting

⚠ Caution

1. Caution on using the basic style or replacing the support bracket.

The lock unit and cylinder rod cover are assembled as shown in the figure below. For this reason, it cannot be installed as in the case of common air cylinders, by using the basic style and screwing the cylinder tie-rods directly to machinery.

Furthermore, when replacing mounting brackets, the unit holding tie-rods may get loosen. Tighten them once again in such a case.

Bore size (mm)	Tie-rod nut	Width across flats	Socket
125 140	JIS B 1181 Class 2 M14 x 1.5	22	JIS B 4636 + 2 point angle socket 22
160	JIS B 1181 Class 2 M16 x 1.5	24	JIS B 4636 + 2 point angle socket 24

Adjustment

⚠ Caution

1. Adjust the cylinder's air balance.

Balance the load by adjusting the air pressure in the rod and head sides of the cylinder with the load connected to the cylinder and the lock released. Lurching of the cylinder when unlocked can be prevented by carefully adjusting this air balance.

2. Adjust the mounting positions of the detectors on auto switches, etc.

When intermediate stops are to be performed, adjust the mounting positions of detectors on auto switches, etc., taking into consideration the overrun amount with respect to the desired stopping positions.

Pneumatic Circuit

⚠ Warning

1. Be certain to use an pneumatic circuit which will apply balancing pressure to both sides of the piston when in a locked stop.

In order to prevent cylinder lurching after a lock stop, when restarting or when manually unlocking, a circuit should be used to which will apply balancing pressure to both sides of the piston, thereby canceling the force generated by the load in the direction of piston movement.

2. Use a solenoid valve for unlocking which has a large effective area, as a rule 50% or more of the effective area of the cylinder drive solenoid valve.

The larger the effective area is, the shorter the locking time will be (the overrun amount will be shorter), and stopping accuracy will be improved.

3. Place the solenoid valve for unlocking close to the cylinder, and no farther than the cylinder drive solenoid valve.

The shorter the distance from the cylinder (the shorter the piping), the shorter the overrun amount will be, and stopping accuracy will be improved.

4. Allow at least 0.5 seconds from a locked stop (intermediate stop of the cylinder) until release of the lock.

When the locked stop time is too short, the piston rod (and load) may lurch at a speed greater than the control speed of the speed controller.

5. When restarting, control the switching signal for the unlocking solenoid valve so that it acts before or at the same time as the cylinder drive solenoid valve.

If the signal is delayed, the piston rod (and load) may lurch at a speed greater than the control speed of the speed controller.

6. Basic circuit

1) [Horizontal]

2) [Vertical]

[Load in the direction of rod extension]

[Load in the direction of rod retraction]

Series CNS Specific Product Precautions 3

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Pneumatic Circuit

⚠ Caution

1. A 3 position pressure center solenoid valve and regulator with check valve can be replaced with two 3 port normally open valves and a regulator with relief function.

[Example]

1. [Horizontal]

2. [Vertical]

[Load in the direction of rod extension]

[Load in the direction of rod retraction]

Manually Unlocking

⚠ Warning

1. Never operate the unlocking cam until safety has been confirmed. (Do not turn to the FREE side.)
 - When unlocking is performed with air pressure applied to only one side of the cylinder, the moving parts of the cylinder will lurch at high speed causing a serious hazard.
 - When unlocking is performed, be sure to confirm that personnel are not within the load movement range and that no other problems will occur if the load moves.
2. Before operating the unlocking cam, exhaust any residual pressure which is in the system.
3. Take measures to prevent the load from dropping when unlocking is performed.
 - Perform work with the load in its lowest position.
 - Take measures for drop prevention by strut, etc.
 - Confirm that balanced pressure is applied to both sides of the piston.

⚠ Caution

1. The unlocking cam is an emergency unlocking mechanism only.
During an emergency when the air supply is stopped or cut off, this is used to alleviate a problem by forcibly pushing back the release piston and brake spring to release the lock.
2. When installing the cylinder into equipment or performing adjustments, etc., be sure to apply air pressure of 0.25 MPa or more to the unlocking port, and do not perform work using the unlocking cam.
3. When releasing the lock with the unlocking cam, it must be noted that the sliding resistance of the cylinder will be high, unlike normal unlocking with air pressure.

Bore size (mm)	Cylinder sliding resistance (N)	Cam unlocking torque (standard) (N·m)	Width across flats (mm)	Socket
125	961	68.6	16	JIS B 4636 + 2 point angle socket 16
140	1216	78.4	18	JIS B 4636 + 2 point angle socket 18
160	1579	156.8	21	JIS B 4636 + 2 point angle socket 21

4. Do not turn the unlocking cam (the arrow or mark on the unlocking cam head) past the position marked FREE. If it is turned too far, there is a danger of damaging the unlocking cam.
5. For safety reasons, the unlocking cam is constructed so that it cannot be fixed in the unlocked condition.

Locked state

Manually unlocked state

[Principle]

If the unlocking cam is turned clockwise with an adjustable angle wrench or socket wrench, etc., the release piston is pushed back and the lock is released. Since the lever will return to its original position and become locked again when it is released, it should be held in this position for as long as unlocking is required.

Series CNS Specific Product Precautions 4

Be sure to read before handling. Refer to front matters 42 and 43 for Safety Instructions and pages 3 to 11 for Actuator and Auto Switch Precautions.

Maintenance

⚠ Caution

1. Lock units for Series CNS are replaceable.

To order replacement lock units for Series CNS, use the order numbers given in the table below.

Bore size (mm)	Lock unit part no.
125	CNS125D-UA
140	CNS140D-UA
160	CNS160D-UA

2. How to replace lock unit

- Loosen the tie-rod nuts (4 pcs.) in the cylinder rod side by using a socket wrench.
For the applicable socket, refer to the table below.

Bore size (mm)	Nut	Width across flats	Socket
125, 140	JIS B 1181 Class 2 M14 x 1.5	22	JIS B 4636 + 2 point angle socket 22
160	JIS B 1181 Class 2 M16 x 1.5	24	JIS B 4636 + 2 point angle socket 24

- Apply compressed air of 0.3 MPa or more to the unlocking port, and remove the lock unit.

- Similarly, apply 0.3 MPa or more of compressed air to the unlocking port of the new lock unit, and replace the new lock unit's temporary axis with the previous piston rod assembly.

- Tighten the tie-rod nuts (4 pcs.) on the rod side of the cylinder using a socket wrench.

⚠ Warning

Never disassemble a lock unit of Series CNS.

- Since a heavy duty spring is contained in the unit, there is a serious hazard, such as the possibility of parts being ejected, if disassembly is performed incorrectly. Therefore, do not loosen or remove the hexagon socket head cap screws which secure cover A and cover B.
- Be sure to contact SMC regarding disassembly or repair, etc.
